					Total Road Miles	0.45	0.95	1.28		Climate Ready Culverts	#	0	N/A				

Note: Total miles impacted per road were calculated using the greatest sea-level scenario (6.3') extent.

The Climate Risk in the Seacoast: Assessing Vulnerability of Municipal Assets and Resources to Climate Change (C-RiSe) project provides maps and assessments of flood impacts to infrastructure and natural resources in the coastal Great Bay region associated with projected increases in storm surge, sea level, and precipitation.

TRANSPORTATION ASSETS: TOWN OF NEWINGTON

Extent of Projected Tidal Flooding Sea-Level Rise + Storm Surge 1.7', 4.0', 6.3'

SLR Legend Impact Legend

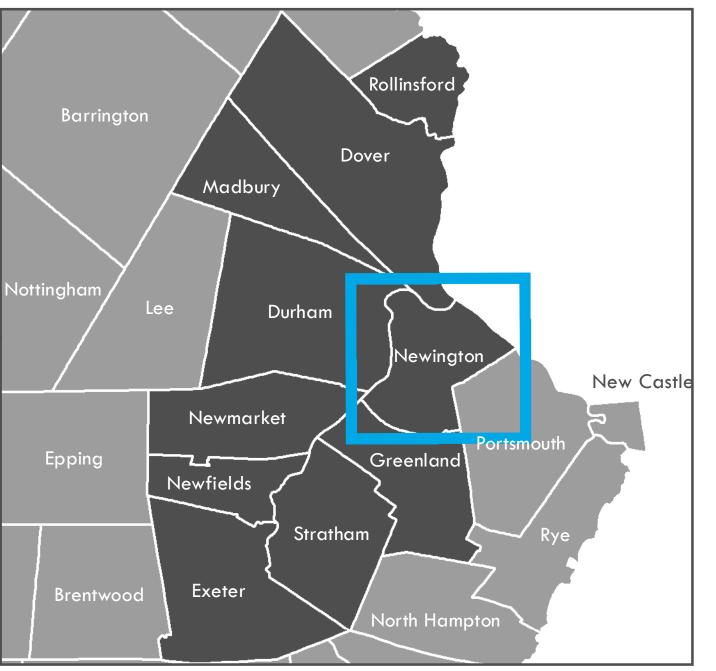

Extent of Sea-Level Rise of 1.7' with Storm Surge

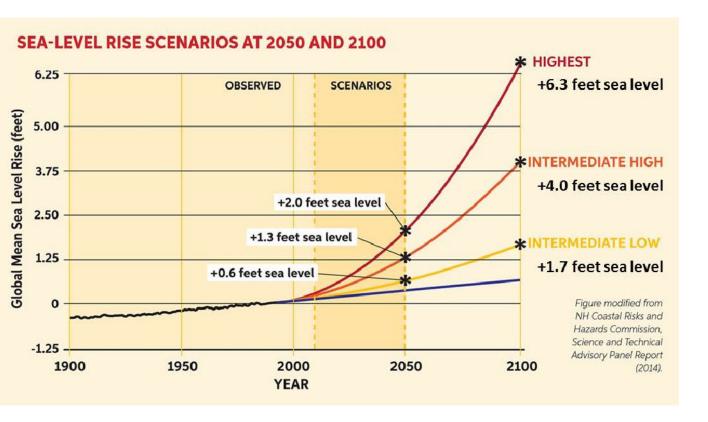

DOT Projects

Roads Impacted By Sea-Level Rise of 6.3 Feet w/ Storm Surge
Roads Impacted By Sea-Level Rise of 4.0 Feet w/ Storm Surge
Roads Impacted By Sea-Level Rise of 1.7 Feet w/ Storm Surge

NHDOT projects were derived from various sources within the New Hampshire Department of Transportation and may have been updated at different times and with varying levels of accuracy. Given redundancies and the need to provide meaningful maps for planning purposes, SRPC generalized projects according to vulnerable areas. A more comprehensive list of impacted projects can be viewed within the community's vulnerability assessment chapter.

Sea-Level Rise Scenarios

Please note that the sea-level rise scenarios used in this assessment were derived from the Wake, 2011 report (refer to table of values below from this report). These scenarios were selected prior to the release of the Science and Technical Advisory Panel Report to the N.H. Coastal Risks & Hazards Commission, in August, 2014 [1]. While slightly different than the scenarios cited in that report, they yield coverage estimates that are within the mapping margin of error.

[1] Wake CP, Kirshen P, Huber M, Knuuti K, and Stampone M (2014) Sea-level Rise, Storm Surges, and Extreme Precipitation in Coastal New Hampshire: Analysis of Past and Projected Future Trends, prepared by the Science and Technical Advisory Panel (STAP) for the New Hampshire Coastal Risks and Hazards Commission.

	20	50	21 00				
	Lower	Higher	Lower	Higher			
Current Elevation of MHHW a,b	4.4	4.4	4.4	4.4			
100-Year Flood Height	6.8	6.8	6.8	6.8			
Subsidence	0.0	0.0	0.0	0.0			
Eustatic SLR	1.0	1.7	2.5	6.3			
Total Stillwater Elevation a.c	12.2	12.9	13.7	17.5			

b - MHHW: Mean Higher High Water at Fort Point, NH c - Total Stillwater Elevation may not equal total of components due to rounding Table 13. Estimates (in feet) of future 100-year flood Stillwater elevations at Fort Point under lower and higher emission scenarios (relative to NAVD88) based on the statistical analysis presented in this report.

Data sets were retrieved from the NH GRANIT database, December, 2015. Digital data in NH GRANIT represent the efforts of the contributing agencies to record information from the cited source materials. Earth Systems Research Center (ESRC), under contract to the Office of Energy & Planning (OEP), and in consultation with cooperating agencies, maintains a continuing program to identify and correct errors in these data. Neither OEP nor ERSC make any claim as to the validity or reliability or to any implied uses of these data.

The C-RiSe project is funded by the National Oceanic and Atmospheric Administration under the Coastal Zone

under Section 309 of the CZMA

(16 U.S.C. § 1456b).
